T-6 TRAINER equipped with Goodyear Cross-Wind Landing Wheels; note relative position of gear—parallel to runway as plane crabs into wind. Inset shows close-up of Goodyear gear.

The Results are in!

Air Force Test Shows **CROSS-WIND** LANDING WHEELS Eliminate Ground-Looping

After 3,598 student landings, results are in on the Air Force evaluation program of the revolutionary Goodyear Cross-Wind Landing Wheels on T-6 Trainers: during the six month test, no ground loops and no landing accidents—compared with 7 in the first 40 hours using conventional gear.

This outstanding safety record is directly due to the new Goodyear Cross-Wind Landing Wheel. This gear permits cross-wind landings with far greater safety than conventional gear, because it lets pilots land without reference to wind heading. The gear “casters” to follow the runway, while the plane itself heads into the wind.

Wherever aircraft safety is concerned, you'll find Goodyear developments in the forefront—and Goodyear products first choice of fliers everywhere—as proved by the fact that more aircraft, the world over, land on Goodyear tires, tubes, wheels and brakes than on any other kind.

The *Concave* RB-36 Reconnaissance Bomber is equipped with **ZENALOY®** parts by **ZENITH**

The four-engineered Conair RB-36, equipped with the most powerful cameras ever installed in its wingspan, is designed to serve as airborne eyes and ears for the Strategic Air Command. It operates in the stratosphere, can speed more than 425 miles per hour, and its mission is to pick out and bring back the facts on enemy targets, no matter how well hidden, guarded or defended.

The delicate and complex electronic equipment designed to aid in this vital task is housed in and protected by ZENALOY® - plastics produced by ZENITH.

For any gain or product contributing to the defense program that can be manufactured in reinforced plastics, communicate with the ZENITH Engineering Division today.

New Departure operates guns-and-butter plants

Ball bearings are essential to the products of our industrial might.

The ball bearings that serve millions of automobiles, trucks, tractors, farm implements, electric motors and industrial machinery are of the same materials, the same heat treatment, the same methods of precision manufacture as those required for mechanical warfare and electronic instruments. This conversion from one to the other at New Departure is largely a matter of changing the emphasis on types and sizes.

The productive capacities of the world's largest ball bearing factories are your assurance of the best possible production of your requirements.

New Departure's engineers and vast resources for research are freely at your disposal.

New Departure's plant at East Hartford, Conn., where ball bearings are produced for all industries and the American Export.

Saving Ground Time in Mid-air . . . with the Sperry **Engine Analyzer**

► Now Northwest Airlines saves ground time in mid-air! With the Sperry Engine Analyzer installed on all Northwest Airlines' Stratocrafters, flight engineers can get a continuous visual analysis of each engine's performance while in flight. Graph-like patterns on the Analyzer scope locate and identify irregularities in power plant operation.

► Upon landing, flight log information directly transmits from automatically to those parts that require servicing . . . avoids prolonged engine running on the ground.

Result: Northwest Stratocrafters spend less time in the air—less time on the ground.

► Sperry's Engine Analyzer is the first complete system available for use on jet to isolate detected engine deficiencies. This instrument pays for itself in a matter of months. Aside from saving ground maintenance time, it also enables the flight engineer to maintain proper operating techniques at all times.

... provides continuous component replacement.

► The Sperry Engine Analyzer reflects this company's many years of experience in the precision manufacture of instruments designed to aid aviation.

NEWS DIGEST

DOMESTIC

General Electric Co. and the Pratt & Whitney Co., Ltd., have confirmed American West's announcement of their agreement for exchange of information on jet engines (Feb. 18, p. 11). Pratt & Whitney has approval of both USAP and Federal Ministry of Air, review all of the aircraft gas turbine, review all of the companies, inclusive of their economic rating system power.

Cessna Aircraft Co. and Selsol Helicopter Co. have announced completion of negotiations for acquisition of Selsol interests with Boston stock Charles M. Selsol will join the Cessna organization as chief engineer of the helicopter division.

Armstrong for the B-47 will be produced by General Electric, GE will also produce the same equipment at Schenectady. The new instrument details mentioned will be installed on the new aircraft jet engine.

Exports of civil aircraft weighing 6,000 lb and less totaled 36 units valued at \$716,991 in January. Domestic exports rose 40 percent to \$260,235.

Complete civil aircraft shipments in 1951 totaled 2,477, weighing 5,112,000 lb, and valued at \$53.9 million. The unskilled December shipments of 152 planes weighing 630,000 lb and worth \$11.1 million. November shipments were 162 planes, valued at \$18.5 million. December engine shipments were 967 aggregating 199,000 hp, making a 1951 total of 4,500 aggregating 2,091,300 hp. Employment in plants making aircraft, aircraft, civil and military, was 52,595 in December, up 2% from November, and 61% above December, 1948. Engine plants employed 31,256, up 4% from November, and 68% from December, 1948.

Heart attack killed UAL Captain L. C. Brown while he was flying Strato-craft from Honolulu to Los Angeles Feb. 24. Captain took over and brought 45 passengers and crew of seven safely back to Honolulu.

Pittsford HUP-2 production helicopters have gone into Navy service. The tandem rotor craft cause Sperry radio pilots. They are the first production copies to incorporate autopilot control.

FINANCIAL

Douglas Aircraft Co. reports sales of \$125,175,000 and backlog of \$1,635 million at the end of its fiscal year, Nov. 30, 1951. Backlog as Dec. 31 was \$1.5 billion. Net earnings were \$6.8 million or 55% per share, earnings before taxes were \$85.0 million.

Boeing Aircraft Corp. reports sales of over \$20 million for the first six months of its fiscal year, giving a profit after taxes of \$555,719 or 94 cents a share. Sales for similar period last year were \$42.6 million. Backlog is over \$410 million.

Sperry Corp. has declared a quarterly \$200 dividend payable Mar. 19 to stockholders of record Mar. 3.

General Corp. reports consolidated consolidated net profit of \$1,157,600 for six months ended Dec. 31, 1951, on sales of \$28.7 million. Profit before taxes was \$3.7 million.

Aermacchi Corp. has voted to distribute \$50 stock dividend of 77,500 shares Apr. 1 to stockholders of record Mar. 1.

Boeing Aircraft Co. has increased its quarterly dividend from 15 cents to 20 cents a common share, and has voted an extra dividend of 20 cents. Both are payable Apr. 15 to stock of record Mar. 1.

INTERNATIONAL

Pratt & Whitney has ordered three Lockheed Super Constellation for delivery in November, 1952. They are scheduled to be used for a new Karachi-London service.

Atlas Canada jet engine has successfully completed its 150 hr. type test.

Sabena, Belgium airline, is ordering two new DC-4Bs, for delivery in 1954. The Boeing 707 order for this equipment is tight.

English Electric Canberra flew from London to Tokyo at 530 mph recently, setting a new record for the 3,470 mi. distance.

DATA clearing house transactions in 1951 totaled \$170 million, up 15.1% from the 1950 figure. Basic cost of clearing house in 1951, over \$20 million, has been handled, involving cash exchange to newsworthy that of only about \$50 million.

REPUTATION!

This tool is equipment and the best of men have earned Indiana Gear a nation-wide reputation for producing the best in precision gears.

"Shown above is an intricate planetary gear on which a one-thousandth tolerance must be maintained."

INDIANA GEAR

INDIANA GEAR WORKS • INDIANAPOLIS 4, INDIANA

Smith and Blumenthal, GE's new static-type voltage regulator is built fast and precise. Voltage regulation now is held to full load is better than $\pm 0.5\%$, while recovery to $\pm 0.5\%$ at rated output occurs in less than 0.1 seconds after release from maximum output rate of load.

Strength and dependability are built completely into the regulator. Operation is unaffected by abrupt loads, full or zero, or excursions of 10 G. There are no tube elements, no fragile components, almost nothing to wear out. Operation is good to above 20,000 ft., and between -67°F and $+140^{\circ}\text{F}$.

In G-3's new line of alternators and voltage regulators the advantages of light weight, compactness and reliability of a-c electric systems are available for your aircraft installations. But whether your problem is a c or d.c., a single instrument or complete electrical system, contact your General Electric aviation specialist, or write the General Electric Co., Schenectady 5, N. Y.

You can put your confidence in—
GENERAL GE ELECTRIC

New Static Regulator for Aircraft Alternators Has No Carbon Stacks

Can withstand 10-G oscillation; Remains stable throughout life

Designed to military specification MIL-G-6004, this compact new static-type voltage regulator eliminates routine maintenance, reduces replacement costs, permits better aircraft electronic system performance under extremes of altitude and temperature and eliminates center terminal problems. Both small and rugged, the regulator is designed to control G-3's new line of high performance aircraft alternators.

Here are three significant features:

- Expected useful life above 5000 hours
- No carbon stacks
- Ready to operate—no warm-up required
- Can be used with alternators either wye- or delta-connected
- Negligible voltage drift with temperature

WHO'S WHERE

In the Front Office

R. Paul Wotruba has been named president of Allied Aircraft Inc., rising up from his former post as executive vice president and general manager. He was formerly executive vice president of Lika Central Airlines, scheduled last summer closer in the Midwest.

Robert E. Foster has been designated vice president and manager for the First National Avenue of Berry Corp., Long Island, N. Y. Prior to joining the firm in 1964 is assistant to the president Foster was with Cleveland Copiers Division Co.

Henry C. Pedersen has been made president of Cox & Stevens Aircraft Corp., Milwaukee, N. Y., under of aircraft manufacturing. Edward E. Todd has been chosen vice president of United Aircraft Products, Inc., Dayton, Ohio. Todd has been with UAP for five years as assistant vice president of commercial engineering.

Renald F. Copey, former General Motors executive, has joined Consolidated Vultee Aircraft Corp., San Diego as assistant to the president and general manager. He will handle special assignments in General Motors and general aircraft design, development and production programs. During World War II, Copey was active in the Boeing B-29 program for GM.

Changes

Arthur Fane has been named chief of Engine Engineering Corp.'s aircraft design division. Ronald P. O'Brien promotion to chief. Karl Kunkler to chief of the Mechanical Design division and George Doan to chief of the Electronics division.

John H. Little has been designated manager of minor lines for the Golden Co., Cleveland, Ohio, succeeding F. L. Long who has gone to this firm's General Industries division.

Tom Ambrose has been named chief engineer of Allison Inc., Linden, N. J., variable components section for jet engines and allied fields.

Charles W. Sanford has been named sales manager at Jack H. Hulse, Inc., Cleveland.

Richard H. Owers formerly with Comair, Ft. Worth, has joined Norton Engineering Co., Woonsocket, R. I., as operations manager.

Marvin L. Nelson has been made vice president of Allied Aircraft Co. a new 301,000 sq. ft. Midway works. Don Mason, former Jones Oil Co. has been appointed special sales representative for the American Republics division of Air America, where he will reinforce and market new products.

Charles F. Drenth has been made an assistant to the vice president operations, Bell Aircraft. William E. Foster has been named assistant to the vice president for the scheduled freighter carrier.

J. Duane Collier has been designated head of a new military division at North West Airlines sales department.

INDUSTRY OBSERVER

■ USAF and Navy's Baker are enthusiastic about a new landing and sighting gear, dubbed the hydro-oki, for high-speed tactical fighter planes. It is designed to replace conventional belly floats. The new hydro-oki are much smaller and lighter than floats, can easily be retracted. Two versions, towing and submerged, have been developed by Eds and All American Aviation. Navy has already carried out flight tests using a Shuman OY-3, and USAF and Navy are reportedly planning a whole series of new combat planes for the new flying gear. The equipment would also be made up in its form to install on planes in the field. Highly successful NACA experiments with hydro-oki to capture military aircraft landing characteristics spurred the new hydro-oki development.

■ Increased USAF interest in stall warning indication is seen in installation of Safe Flight device on Boeing B-70. Stallstrip booms to indicate safe approach speeds, permitting loadings taking up much less roll and allowing use of smaller fields by the jet bomber. Evaluation on the Convair B-56 is also being planned.

■ Navy is evaluating an external light hooked up to stall warning instrumentation so its jet might light up to notify aircraft carrier landing aid officers when plane is approaching stall.

■ Stock taken by small North Bonanza and Ryan Navion are under development by Safe Flight Instrument Co., which has fitted its own Bonanza with a modified ruckery model for trials. CAA is tied to be planning installation of stick shakers on its twin-engine trainers, USAF is testing the device at Eglin AFB, Fla., on a C-47 and a North American P-51.

■ Second Paper PA-6 Skyrocket four place, low wing, all-metal personal plane with retractable landing gear, developed by the company as a first step to compete with the Navion and Bonanza, is being used by Piper at a company executive plane and to put up some aircraft in present production slowdown. The second model is fitted with a 185 hp Continental, where the first craft had a 107-hp engine. Plans to produce the Skyrocket were abandoned when drawing costs indicated part would have to be about \$2,000, considered too high to meet the competition.

■ Grumman Aircraft Co.'s new low-wing two-engine S-6 plane has been reported sitting on eastern airport, where some people at first mistook it for a Beech Twin Bonanza. The new Grumman is said to be started to take small turboprop engines.

■ The new Westinghouse J46 engine which was scheduled to replace the Westinghouse J34 in the upcoming Douglas F1D-3, now becomes a one airplane engine as far as production contracts are concerned. It is going into the Navy Chance Vought Corsair F7U-3, as a first installation, but that's all. Westinghouse has enough commitments on its books J46 engine to take up any slack resulting from the F45 program, however.

■ First production use of Allison's big turboprop engine, now called the J15A-23 and now the JT3, will probably be in a new turbofan version of the Northrop F-5F Scorpion night fighter, replacing the Allison J15A-23 engines now operational in the F104 Scorpion. The engine which probably is a year off, but when it comes the new Scorpions will have approximately one third more power, since the JT3 is rated in the over 5000-hp thrust class.

■ Current contract for its delta-wing production prototype XE-102 with electronics intercepter armament system is modification by Hughes Aircraft Co. is still needed in Air National Command and type. Contract difficulties involve aircraft stability of Canada and for Canada and for United States rights of developments combined as the XE-101A delta-wing research aircraft.

Three Results of the Stretch-Out on

Financial, Industrial & Military Outlook

Full implications of the stretch-out of military aircraft production only now are beginning to be apparent. Accordingly, *Aviation Week* asked its financial expert last week for a special report on the stretch-out's effects. Concurrently, the president of the Aircraft Industries Assn. stated the official position of the industry. To round out the perspective, one of the magazine's editors reports military aspects on the basis of recent discussions with top Pentagon officials. These reports for the first time bring the picture into sharp focus.

I. The Financial View

By Selig Abraham

While the "stretch-out" of aircraft production schedules will eventually lead to a number of early consequences, the long-range implications may well turn out to be quite constructive for major segments of the industry.

Previous schedules have been labeled as highly unrealistic. To attain past goals would have demanded the nation's economy to run on a quarter faster than that experienced during the post-war slump. Unemployment is becoming a serious problem in industries that off from raw materials devoted to the industrial program. Moreover, the general resistance to further taxes in times also may have served to place a burden on the recent record of accelerated aircraft production schedules.

■ **Schedule Extension.** It is ironic, however, that the Administration's concern for the nation's economy by imposing curbs on aircraft production will prove beneficial and early in other directions. For example, subcontractors who had expected to participate in the heavy aircraft procurement program have been among the first to be hit by curbs. Business has either been cancelled or stretched out. This will make it difficult and costly for them to action the terms of labor deals negotiated for full schedules.

It also will serve to increase their operating costs. Without extension protection in their contracts they are faced with a real squeeze. Moreover, their resources are threatened in areas they are unable to obtain more steel, copper or aluminum for normal civilian production to fill the gap created by the defense slowdown. A great many subcontractors are in the "small business" category—a group having the moral support of Congress and the Administration. Yet, the curbs have been very harmful to this group.

There is no question that lower monthly quantities of aircraft will lead to increased unit costs. Moreover, by raising schedules and forcing cancellations in various defense added items have been imposed upon those aircraft builders. In most instances this will be passed on to the government. However, extended aircraft savings of the curbs will be offset to some degree by these various adjustments going to increase the cost on the existing procurement program.

■ **Industrial Schedule.** Yet, once all the present adjustments

are satisfactorily effected and absorbed, the prime aircraft builders, in a group, may be cutting one of the most stable profitable periods in their history.

To have reached the now-called "accelerated" schedules would have meant a very rapid build-up by the end of 1952 or early 1953, with completion of most of the program in 1954. At that point, unless international conditions were to deteriorate even further, the aircraft industry would have been due for another sharp decline.

It is these sharp peaks and valleys which as the past have pointed extremely risky to industry and government alike. This "accelerated" pattern has also made difficult the planning and achievement of long-range engineering programs in aircraft in the aircraft industry.

Revised production schedules now indicate that the 141-wing Air Force and 100 Naval aviation programs, instead of being achieved in 1954 as first planned, must likely be accomplished some time in 1956. This is of far-reaching significance and is highly consistent to long-range plans of the aircraft industry. Should present plans hold, production will require a far more careful pattern and be maintained at a high plateau over a longer period of time, extending through 1955 and possibly beyond. Nor will before the aircraft industry, improved stock exchanges of sustained high volume output under more orderly conditions projected in the future.

■ **Funds vs. Sales.** According to latest available figures, aircraft building aggregate some \$11 billion. By contrast, 1951 sales, more estimated at about \$5 billion. For the 1950 period, sales (June 30, 1952, about \$25 billion had been appropriated by Congress for aircraft procurement. The total contracts with \$15 billion appropriated in the first two years of World War II. Hence, it can be seen that with this appropriated funds are about five times that of 1951 industry sales.

While the re-evaluating purchase budgets of fiscal 1951 and 1952 provide for substantial increase deliveries of new aircraft, it is highly significant that not a single cent has been added to the total defense budget in the fiscal year since these funds. It usually takes about two years from the actual order placement to incorporate such new planes into the military structure.

Yet to come are funds to be provided for the projected

1953 fiscal budget. If approved by the Congress, another \$14 billion in contract authorizations for new aircraft procurement will be made available on top of the appropriations on hand. This would make a total of some \$39 billion for aircraft procurement—almost more than five times the actual dollar volume of 1951.

■ **Changes Unlikely.** Admittedly, while economic talk for the budget may appear during 1952, an effective rise, any significant change in the current economic program, appears unlikely. In fact, as in the past, any international crisis is likely to see an accelerated move for more aircraft production. On the other hand, events in central areas have demonstrated that overall levels of aircraft procurement remain relatively unaffected by outward indications of a loosening of international tensions (i.e., the Korean peace "talk").

Moreover, while actual appropriation may be reduced slightly, as effective building can be conducted through contract authorizations to be financed by government bonds in subsequent years. However, current executive and legislative powers, the military services can be authorized to order into continued obligations for delivery of equipment in future years. In effect, only such funds as provided from the current fiscal appropriations to initiate production. The balance and bulk of the assets due as each commitment will come from appropriations of subsequent years. This tends to make believe current appropriation as providing a far larger aircraft program.

■ **Peace Strong Air Arms.** With an air-minded Congress, any change in the Administration is unlikely to alter the present buildup of air power. In fact, the leading Republican opponents for the president, directly or through their supporters are known to be inclined toward a strong air arm as an national defense alternative.

It must not be concluded that conservatism is necessarily taking its toll of existing members of military aircraft. For example, the Secretary of the Air Force reported that during the current fiscal year 1952 the Air Force inventory consisted of about 30,000 aircraft of which more than 75% were World War II types over an even old and scheduled to be declared obsolete by June 30, 1957. Accord

ingly, even without regard to a build-up of the Air Force to 141 wings, more than 14,400 aircraft in that service are due for replacement by new models and advanced types. A long-range program for building up air is a result of factory underwork and high volume output in the aircraft industry appears likely to occur in the immediate period ahead.

■ **Long-Term Expansion.** In any long-range expansion of aircraft production there is a perspective period where backlog, training personnel, assembling materials and components must take place before any volume output can result. In addition to the normal aircraft production to large-scale manufacturers the aircraft builders now laid off during 1951 by short ages of materials, machine tools, and strikes—directly and indirectly.

Strikes in aluminum plants, for example, created short ages of raw materials which prevented production of jet engines on schedule. This, in turn, served to slow down the entire jet production schedule.

■ **Lead Time.** The long lead time in aircraft production is now largely accomplished for most aircraft companies. Machine tools and components bottlenecks are being solved. Essential materials are also flowing more readily to the industry.

The tangible evidence of improving metal processing deliveries, it is only necessary to examine recently issued inventory reports of a few aircraft companies. For example, during the first six months of 1951 General Motors total sales of \$68.5 million. The report for the year indicates that deliveries for the second half were about \$95 million.

Douglas despite a five-week strike at its Long Beach plant, reported billings of about \$72 million for its fourth quarter ended Nov. 16, 1951. This compares with a sales volume of only \$59.3 million for the first quarter ended Feb. 28, 1952.

The aircraft industry remains essentially a contracting business and cannot be sustained on a short term basis. Aircraft production contracts are less strong to be extended simply. The planning and preparation of 1951 and prior years is based on the schedule for volume production during 1952 and the immediate years beyond.

II. The Industrial View

By DeWitt C. Hunsay (Aircraft, ESN, et al.)

President, Aircraft Industries Assn.

Target dates for the air power build-up have been deferred some 14 months. The airplane industry officials, particularly anxious to national security will not be achieved in the 1954 as planned, but in 1955.

This revised goal, which involved a 141-wing Air Force and a proportionate increase in Naval air, became public knowledge when Secretary of Defense Lovett and Secretary of the Air Force Finletter so advised a committee of Congress recently. This followed notification to the various agencies that its production rates would be slowed to fit the new schedule provided by in the 1955 fiscal budget.

■ **National Policy.** There is no question that this change runs the obvious burden of the aircraft industry to a considerable extent. To attain the earlier schedules would have required a much heavier load on the facilities of construction, industry—contract, manpower and machine tools. We would have required programs far higher than we are now had to do. The national policy, founded on the theory that a leader civilian economy is needed to support measurement and the maintenance of a large military establishment over an unprofitable number of years, would have had to give way to a more exact.

The American aircraft industry proved that it could expand rapidly and outproduce the world as well as in World War II. The industry's production rose from 6,000 military aircraft in 1940 to 56,000 in 1944 and in effecting the achievement it became the largest industry the world has ever known. But no such record can be repeated in a peacetime-normal economy. And, true as the world situation is today, no industry can be used yet for the production that would be required by the staggering debt of all of our wartime production effort.

■ **Plant Building.** Up-but it is important that, as the real growth of the nation's air power begins, we not lose sight of the magnitude of the task it stands. The industry has not slowed down, it is still building up. Our production rates are increasing and must continue to increase for at least another two years. Our materials and mechanical and manpower needs have not slackened, but they will slowly ease as the backlog of construction which have played up in the last few years of giving way under increasing production of basic materials and machine tools, but they will not ease without the constant vigilance of the industry, the military and the civilian government agencies.

There is no alternative in the serious shortage of engineers of which the aircraft industry has warned again and

Thermocouple-Meter—This type of assembly is widely used in temperature applications, where a differential change in resistance in the bellows and sensing wire is used to measure temperature changes.

AERONAUTICAL ENGINEERING

Revolution Brewing in Aviation Design

- RPT's Prof. Neil P. Bailey advances a new thesis which upsets established thermodynamic fundamentals.
- The new concept should make aerodynamics a more exact science, eliminating much of today's cut-and-try.

A new and revolutionary thesis in thermodynamics—one of the foundations of today's aeronautics—has been developed by Neil P. Bailey, Russell Sage professor of mechanical engineering at Roselandia Polytechnic Institute, Jersey, N. Y.

His ideas on the "logical combination of 15 years of individual researching. They are controversial ideas, impossible in a single session of meeting. That's why the thesis is so revolutionary.

But they merit detailed re-examination and revitalization of one of the bases of thermodynamics—the steady-flow equation.

Early in his long career of working and teaching in thermodynamics, Bailey became aware that there had been built in somewhere along the line of development of his subject. "Assumed value of flow did not check the predicted rates, unexpected temperatures, flow instabilities and discontinuities were found that were not anticipated."

Previous studies were to attribute these differences to experimental or instrument error, but modern techniques and apparatus should have revealed these errors to measure. The only place left to look was in the formulas which supposedly described the flow process.

This level surface—anywhere for the world of aerodynamic engineering—shows the track of Bailey's thinking. It is based to start again, because it differs from a norm which has been accepted for a century.

Such thinking means that there will be serious revision of basic texts in aerodynamics and its root sciences of fluid mechanics and thermodynamics. Vapor and gas tables will have to be revised and prepared in a new form.

But with the help of these new formulas, aircraft and engine design can become more of an exact science. Now dependent in large measure on the experience of craftsmen, empirical data, the designer will be able to use mathematics for paper studies. He will be freed from some of the more expensive aspects of cut-and-try development.

Where will these theories apply? Primarily wherever air moves—and that covers the field of aerodynamics.

In various applications, they apply to the design of engine air intake and exhaust ducts, the flow over the wing at high angles of attack and the stall.

Superiorly, they may be used for calculation of flow pattern around and through aircraft and missile bodies and wings. They can predict flow stability and shock formations over wings and other surfaces.

In engine work, they can calculate the characteristics of compressor and turbine blades. They can develop the understanding of flow instability in turbo and in combustion chambers.

And these new concepts will enable new methods of approach for design and determine new goals of efficiency to reach.

Memo to Engineers:

Flow is now fast at the only fundamental change in a century of fluid-flow concepts.

It is a re-examination and revision of the basic principles of thermodynamics by Neil P. Bailey, Russell Sage professor of mechanical engineering at Roselandia Polytechnic Institute.

Because of the far-reaching effects of Bailey's contribution on engineering thermodynamics and hydrodynamics—principles of today's aeronautics—American trade journals have announced that the theory of his fundamental laws, "Thermodynamics," "Process," "McGraw-Hill Publishing Co."

Dr. Bailey's Basic-Concepts aerodynamics theories are based on century-old concepts of thermodynamics and fluid mechanics. Instead of developing new concepts, we have adopted the old ones. We have accepted dogmatic facts. We have misinterpreted development by terms abstract and calculated results. We have, in short, built conclusions into these subjects.

The intervening years have shown no fundamental changes in thinking

about the flow problems of highly compressible fluids, perfect gases, molecular flow and the other aspects of aerodynamics.

But the years have also brought us progress in measuring techniques and test apparatus. And now we are sure that discrepancies—not attributable to experimental and instrument errors—do exist, and that classical theory does not and can not explain them.

These differences between theory and tests indicate the whole truth of Bailey's development. From careful study with accurate measurements, from philosophical thought and discussion, from paper studies, the truth is right back to the fundamental theories of thermodynamics—DAA.

The New Concept

Work is properly defined by a force acting through a distance, and this states the only way in which mechanical energy can be transmitted from one system to another. Moving fluid systems possess kinetic energy because they are flowing, and gases and vapors possess internal energy by virtue of molecular motion and spacing.

Energy is stored in gases because of this position, but they actually do not possess such energy. The elevation merely defines a state with respect to the earth. That energy can be removed by the heat only to its true more distant, the force of gravity actually performs the pressure work. If they move downward to a lower elevation they will exert heat energy.

This is in contrast with the free potential energy of a compressed spring which does have actual energy stored in its coiled state. Energy is stored in gases because they are flowing through deformation distances.

Energy is often referred to in pointing energy because their heat is not a process. Again, this pressure merely defines a state and does not represent energy. A noncompressible fluid which will not deform will not be able to do work because it has no internal energy because the applied compressing force moves through no distance.

When an elastic fluid such as a gas is vapor has its pressure under there in a well-defined manner, because the gas pressure force acts through a deformation distance. However, just as in the

Now— advanced electronic instrumentation

...simplified by "building block" electronic packages
makes possible synthesis of present and future aircraft
control systems.

Servomechanisms, Inc., has pioneered in developing functionally packaged standard plug-in units for electronic and electro-mechanical aircraft instrumentation. Servomechanisms techniques of INOCHRONICS... the multiple and interchangeable use of standard units achieves simplified control systems which solve the aircraft need for:

- Instant Maintainability
- Training Simplicity
- Special Adaptability
- Ease of Assembly

A typical Servomechanisms, Inc. control system showing the multiple combination of building blocks, each block easily removable and replaceable with a simple in stock and service

SERVO MECHANISMS
ADVANCED FUNCTIONAL COMPONENTS

East Greenwich, R.I. POST & STURGEON AVENUE, WESTFIELD, N.Y. 01096, Cal.

FIG. 3. Relationship to energy and pressure ratios with fluidity ratio for given flow of water and liquid.

increasing both of them & certain amount of kinetic energy with a low impedance energy will not result in the same flow rate due to the same kinetic energy with a higher impedance energy.

This means velocity is slow is not a proper variable to use in studying flow. It is vital to consider the pressure P that is, compresses the volume, whereas flow speed energy is not defined.

To solve for the kinetic energy rate N is defined by:

$$N = \frac{\text{Internal energy}}{\text{Internal energy}} \quad (20)$$

$$= \frac{P}{\rho} \quad (21)$$

$$\text{Corresponding internal energy rate is } \frac{dN}{dt} = \frac{dP}{dt} \quad (22)$$

$$\text{Another very useful concept is } \frac{dN}{dt} \text{ velocity rate}$$

$$= \sqrt{\frac{2P}{\rho}} \quad (23)$$

In terms of these units, creating pressure rate for all fluid flow (24) is defined by:

$$P = \rho \left(\frac{dN}{dt} \right)^2 \quad (24)$$

When given and vapor (density) internal energy changes, value of the compressed energy during the acceleration is significant. Another very useful concept is:

$$\text{Compressible factor } \frac{dP}{dN} = \frac{dP}{dN} \quad (25)$$

Liquid flow into fluids. For liquids in terms of energy is a compressed area and velocity flow equation (26) takes the form:

$$\frac{dP}{dN} = P = \frac{1}{2} \rho \left(\frac{dN}{dt} \right)^2 \quad (26)$$

Then, with (26), completely defines the energy flow of a liquid moving a fluid flow in pressure P , the internal energy of (Fig. 3).

Fig. 3 shows that maximum possible energy flow of a liquid flow is a free open water in a velocity rate of $N = 1.0$ and water pressure $P = 0.5$. Control

control of weight rates of liquid (density) rates of 1.0 to 0.5 show variability on the target given in Fig. 3.

Below $P = 0.5$ and $N = 1.0$ the flow rate falls and is near $N = 1.0$ the flow breaks clear of the hole with Servomechanisms.

Big production job ahead . . .

RADIOGRAPHY checks procedure

Here you see a radiograph of a car engine block. It was a new design—almost ready for production. It was important that it be sound, free from sand or gas holes—and with no core shifts.

To be sure, pilot castings were radiographed. It was the one way to know these internal conditions without destroying the casting.

More and more foundries are making radiography a routine procedure. It is the way to be sure only

high-quality work is released. In production castings, besides ways in which methods can be improved and yield increased.

If you would like to know how radiography could improve your plant operation, talk it over with your x-ray dealer. Also, if you wish, we'll send you a free copy of "Radiography as a Foundry Tool".

TORRINGTON NEEDLE BEARINGS

Needle • Spherical Roller • Tapered Roller • Straight Roller • Ball • Needle Rollers

study a high-profile whirling liquid, in doing so, activity at the one stage (Fig. 3) At higher pressure ratios, the jet can also separate, and between P_2/P_1 of 1 and 3 the blade points out of the solid state (12,200 miles per sec).

Good space relations are given by varying in a ratio less than P_2/P_1 of 3/2 the jet where (mean) is for a time in a turbulent state in the range from below $P_2/P_1 = 1.5$, straight walls later are necessary.

Gas flow into ducts. When a gas flows from a space into a duct both the specific volume V and the internal energy e change. In the case, energy flow equation must be used (13). This can be written as:

$$\frac{P_2}{P_1} \left(\frac{V_2}{V_1} \right)^{\gamma} = \left(\frac{P_2}{P_1} + N + 1 \right) \quad (21)$$

where P_1 and P_2 refer to conditions at the supply open. Pressure required is given by (21).

$$\frac{P_2}{P_1} = \frac{P_2}{P_1} + N + 1 \quad (22)$$

Specific volume V and general energy e can be related for a gas through the conservation factor (22) for a best answer at turbulent:

$$\frac{P_2}{P_1} = \frac{P_2}{P_1} + N + 1 \quad (23)$$

For an ideal gas:

$$P_2/P_1 = 1.414 \quad (24)$$

where P_1 is temperature in deg. K, and C is internal energy specific heat. Equations (21) and (22) can be combined with:

$$\gamma = \frac{C_p}{C_v} + 1 = 1.41 \quad (25)$$

to give the limiting efficiency:

$$\left(\frac{P_2}{P_1} \right)^{\gamma} = \frac{P_2}{P_1} \quad (26)$$

This gives for an ideal gas:

$$\frac{P_2}{P_1} = \left(\frac{P_2}{P_1} \right)^{\gamma} = 1.41 \quad (27)$$

Using (24):

$$\frac{P_2}{P_1} = \left(\frac{P_2}{P_1} \right)^{\gamma} = 1.41 \quad (28)$$

Energy flow of a gas entering an opening from a supply pressure P_1 shown by Fig. 3 starts a maximum at $P_2/P_1 = 1.41$ and $C_p/C_v = 1.41$, and a minimum at $N = (P_2/P_1)^{\gamma} - 1 = 0.41$, also which is a maximum.

Keyed term of many tubes show an ability to adapt in the way of the energy flow open, as in Fig. 3. In the previous case of water, the jet separated from the tube walls, but with air, velocity ratio matter less. The flow starts, according to completely velocity and before each cycle. The quantity is lower than for water and lower energy ratios are involved.

Fig. 4 shows typical curves for such a tube with a pressure ratio just below but velocity ratio.

Liquid turbulent. Space flow of a liquid into a straight-walled tube becomes unstable at an absolute pressure ratio of $P_2/P_1 = 2.2$ because this point represents the maximum energy flow that can enter the duct.

Requirements for a stable liquid mode can be deduced from Fig. 5, in which the flow from P_1 to P_2 is space flow at constant flow or constant energy. From Eq. (20) and (22) for a liquid, the energy equation

Fig. 4. Pressure ratio vs. distance from entrance, inches. The curve shows a sharp drop in pressure ratio as distance increases, indicating a transition from a stable to a turbulent state.

Fig. 5. Temperature ratio vs. distance from entrance, inches. The curve shows a sharp drop in temperature ratio as distance increases, indicating a transition from a stable to a turbulent state.

at 1 is the same as that leaving at 2:

$$P_2/P_1 = 1.414 \quad (29)$$

For steady flow:

$$P_2/P_1 = 1.414 \quad (30)$$

Critical choking conditions occur when $P_2/P_1 = 1.414$ and $P_1 = P_2/1.414$.

This gives a critical pressure ratio for any gas:

$$\left(\frac{P_2}{P_1} \right)_{critical} = \frac{P_2}{P_1} \quad (31)$$

This says that, with a straight-walled tube, the critical pressure ratio is 1.414.

For a gas, the critical pressure ratio is 1.414.

For a gas, the critical pressure ratio is 1.414.

For a gas, the critical pressure ratio is 1.414.

$$\frac{D_1}{D_0} \left(\frac{1}{1 + \beta} + \beta \right)^{\frac{\gamma}{\gamma-1}} = \left(\frac{1}{1 + \beta} + \beta \right)^{\frac{\gamma}{\gamma-1}} \quad (44)$$

The steady flow equation

$$W = \frac{D_1 D_0}{F_1} = \frac{D_1 D_0}{F_2} \quad (45)$$

may be written as

$$\frac{D_1 D_0}{F_1} = \left(\frac{D_1 D_0}{F_2} \right)^{\frac{\gamma}{\gamma-1}} \quad (46)$$

These can be combined to give

$$\frac{D_1}{D_0} \left(\frac{1}{1 + \beta} + \beta \right)^{\frac{\gamma}{\gamma-1}} = \frac{D_1}{D_0} \left(\frac{1}{1 + \beta} + \beta \right)^{\frac{\gamma}{\gamma-1}} \quad (47)$$

Figure 6 of D_1/D_0 reaches a maximum value at $D_1/D_0 = 1.0$, for any α , β , by the varying velocity ratio D_1/D_0 and β become greater than that corresponding to $D_1/D_0 = 1.0$.

Physically, this means that as D_1/D_0 the velocity ratio, as β increases, the velocity ratio D_1/D_0 across the nozzle and an approach will not exceed a value to produce this D_1/D_0 . Further increases will only cause D_1/D_0 to rise.

Equations (44) and (45) can be solved by many ways, together with the speed flow equation

$$F_1/F_2 = 1 + 2\beta \quad (48)$$

One may conclude from Fig. 6, shows that the velocity ratio D_1/D_0 produced by an α and β possible value F_1/F_2 depends on the speed ratio α/β of the nozzle. Also, it shows that the critical primary case at which D_1/D_0 reaches a maximum of 1.0 depends on the nozzle design. It is small greater than or many values of nozzle conditions have been necessary in the past. The conditions of Fig. 6 are not unduly complicated by both.

Temperature Considerations. It has been the custom to assume that a liquid flowing from a region at pressure P_1 through with it an amount of energy $P_1 F_1$ per lb. However, it can be shown that with upper flow

$$\frac{F_1}{F_2} = \frac{1 + 2\beta}{1 + 2\beta} \quad (49)$$

WILCOX ... Choice of
EASTERN Air Lines

**180 Channel WILCOX Communications System
Chosen for Eastern's Entire Fleet of
SUPER CONSTELLATIONS and MARTIN 4-0-4's**

Eastern Air Lines demanded the best communications equipment available to match the advanced, efficient operation of their modern new fleet. No greater equipment could be paid to Wilcox radio equipment than it is selected for the challenging assignment.

The Wilcox 448A VHF Communications System covers all channels in the 118-136 Mc. band. It is light in weight, small in size, and easy to maintain.

UNIT CONSTRUCTION FOR EASY HANDLING
The 50-watt transmitter, high sensitivity receiver, and compact power supply are each contained in

a separate JAN A1-D case. Any unit may be instantly removed from the common mount.

WINGER-UP REMOTE CONTROL
All transmitter and receiver functions are available by remote control. A new channel selector system assures positive operation and minimum maintenance.

DEPENDABILITY AND EASY MAINTENANCE
Simple, conventional circuits minimize the number and types of tubes and require no special training, techniques, or test equipment.

FUTURES, UN-Limited... YOUNG ENGINEERS, with YOUNG IDEAS, find Opportunity's doors opening at LOCKHEED

A few years ago, the LOCKHEED P-47 all-weather fighter-interceptor, armed with four 60-cal machine guns located in the nose, was still a dream on the drawing-board. Its translation into a miracle of engineering achievement is typical of the magic that is happening every day at LOCKHEED.

Other fabulous developments are on the way. Today—Tomorrow—On into the Future—the dreams of LOCKHEED Engineers and Master Craftsmen will continue to become realities. To have a part in such a future is EVERY young Engineer's dream.

LOCKHEED'S GEORGIA DIVISION—at Marietta, Georgia, is now getting into production to turn out B-47 Strategists. Skilled technicians in many categories are needed, to take their proud place in this, and other LOCKHEED contributions to the safety of our nation—and to add their own skills and dreams to future accomplishments. For on LOCKHEED'S design boards, aviation's future is taking shape—in military jet aviation, and in commercial jet aviation.

At LOCKHEED'S GEORGIA DIVISION, only 18 miles from Atlanta, in the famous scenic beauty and year-round fine climate of North Georgia, you'll find under LOCKHEED'S guidance—A BETTER JOB—A BETTER LIFE—A BETTER FUTURE.

Write TODAY to

Mr. Frank J. Johnson, Employment Manager,
LOCKHEED GEORGIA DIVISION,
594½ Peachtree St., N. E., Atlanta, Ga.

FIND OUT HOW YOU CAN BECOME A PART OF LOCKHEED'S THRILLING FUTURE!

(If you prefer the West Coast, your inquiry will be promptly forwarded to LOCKHEED in Burbank, California, where similar openings are available.)

the Navy's Aeronautical Instruments Lab in Philadelphia under the supervision of GLENN F. A. GORAN.

By the spring of 1949, when Baker indicated an interest in placing the G-3 in production, jet fighters were coming into the picture. The higher speeds and the maneuverability requirements of the jet resulted in the loss of some of the inherent stability of piston-engine aircraft. This in turn imposed more difficult stabilization problems on the autopilot design.

Flight tests of the NG-3 at Philadelphia, and later at Patuxent on a Lockheed TD-1 (P-80), pointed up desirable configuration improvements. For example, the NG-3 had two sets of air doors which were canted and decoupled by cables operated from a handle in the cockpit. The cable rigging problems from an experimental aircraft to a production version considerable. They resulted in changing to electric-actuated control cables for engaging and disengaging the trim's output pulleys.

The second jet speed required the addition of laminar airflow control. Demands for improved attitude control dictated abandoning the NG-3's parallel-mounted vertical gyro for a large, accurately located dome. This meant new problems of mounting and controlling a vertical gyro to which the bottom pilot had no access.

Then in the spring of 1950, when delivery of the first production G-3 was only a few months off, Baker made for the addition of a few changes. This included the development of a new component, a rate type gyro. By the time the first G-3 began its test, there was not a single component which had not changed from its NG-3 configuration. However, General Electric's basic auto control approach using torque, rate, gyro, governor, and machine axes has remained unchanged.

► **Heading Intelligence**—The Navy Type G-3 computer, provides the signals for aircraft heading stabilization. The G-3 is a computerized gyro-mounted directional gyro which is read in a flight instrument in most Navy planes. It combines the inherent advantages of a slowly located computer with those of a gyro. Thus it provides a dual heading indication (and signal) which is free of momentary detachment of an arduous computer. Computer malfunction is automatically cut off during hours when the device is used with the G-3. A small actuator within the gyro provides the heading signal for the autopilot.

► **Artificial Intelligence**—Pitch and bank stabilization signals are obtained from a slowly located vertical gyro with internal gyroscope. The latter permits unlimited maneuver in pitch and roll (under manual control) without danger

SOUTH BEND 10"-1" COLLET LATHE

Precision-Built FOR Precision Work

The precision, speed and versatility of this lathe ensures efficient output on tool-room or exacting production work. Precision-built throughout, close tolerances can be consistently held with minimum effort and no sacrifice of output. Its large collet capacity, wide range of feeds and speeds, and numerous available attachments will enable you to keep it busy on a variety of jobs. With its dimensions of 40" to 16-24" lathe, 7" Slapers and 14" Drill Presses.

SPECIFICATIONS:

Swing—10½" Spindle Bore—.1875"
Center Distance—4, 14½ to 24½"
Spindle Speeds—13, 40 to 1217 r.p.m.
Lead and Feed—48, 6.0 to 1.000"
Gear Feed—18, 5.000 to 1.000"
Thread Cutting—13, 4 to 224 per inch.

AUTOPILOT CONTROL, by which it is possible to handle better take-off lands (1, 2 and 3 above) are still used for engagement, turn changes and altitude.

of banking the gyro and reaching less of vertical release. Although the gyro does not have 360 degree freedom of movement in pitch, an ingenious design arrangement causes it to do a controlled "flip flop" during an aircraft loop. The result is that the gyro's pitch axis is approximately vertical when the aircraft comes out of the loop.

To prevent drift, the gyro is mounted by two pendulums within the gyro case. These detect the apparent direction of gravity and operate through two torque motors in the gyro to keep its spin axis vertical. Because of a relatively long time constant in the monitoring servo system, the gyro spin axis is not affected by momentary disturbances of the pendulums. During turns, when the pendulums would tilt up or a false vertical position, the gyro is automatically cut out of the pendulum monitoring.

Because of its desirability in terms of the gyro's initial motion, must be done automatically. Since the manual operation of the gyro is slow (15-20 deg/min), a fast rate of about 180 deg/min is used when the gyro is first started. **Altitude Intelligence**—Signals for the automatic altitude control are generated by a capacitance transducer movement, coupled to the radio line and driving a synchro through a solenoid-operated clutch. The synchro is spring loaded to center so that the unit is always ready for manual engagement.

Yawing Rate Intelligence—A self-generating rate type gyro is used to introduce yaw rate (yaw lead) signals into the autopilot. It has its pendulum element housed in liquid to relieve inertia of the bearing lead and to provide damping. The gyro has a natural frequency of 20 cps and a damping factor of about 0.6. These characteristics should permit its use as a new high-speed servomotor.

Turn Coordination Intelligence—This signal is provided by a small pendulum type accelerometer. The unit has damped

pendulum and positions its suspended member according to the apparent direction of gravity. The unit is mounted in the same case as the rate-type gyro since both have common mounting requirements relative to the plane's principal axes.

Pitch Command—The small panel controller which houses the automatic flight stick also serves as the command control station for the human pilot. It is located in the cockpit console and illuminated by red light. The unit contains the push buttons for engaging and disengaging the autopilot, engaging the altitude control, locking the airplane, and trim knobs for small changes in heading or pitch attitude.

Control Amplifiers—The computer might be called the "brain" of the autopilot. It contains the three main power amplifiers, one for each of the yaw, pitch, and roll channels, for operation of the servo systems.

The unit also contains four identical "boost" amplifiers. Each of these controls a small lightbulb or motor used for synchronizing and in indicator circuitry signals into the main autopilot channels. Two identical vertical gyro rate rate amplifiers are also added.

All major amplifier units are mass mounted components and are connected on quick disconnect type of plug-in members. As a result the G-1 will be the first Navy autopilot amplifier in which internal amplifier repairs will be attempted in a low maintenance location. This is possible because of the ease of replacement of the major amplifier sub-assemblies. The amplifier also includes sequencing and time delay circuits for starting the autopilot. The whole unit is amplifier is relies on switching to various modes of autopilot operation, as well as small safety interlock amplifier circuits and the pilot power supply line to the amplifier.

Servo Actuators—Control surfaces are actuated by three identical servo actuator units. Each servo consists of a split ball

UML's big maintenance base at San Francisco includes such convenience as the

OVERHEAD conveyor system for cylinders in its engine sight window shop.

advantages to low-terrain airports, spark plug cranes only for low terrain, a 100% that at high terrain, spark plug removal rate on DC life be 600 in. A 400-lb. removal rate has been established for the DC life be cause of the increased power pulled from these engines. (UML uses General Motors A3781 plugs in all its engines except for the five cylinders of the DC-10 engines which mount DC 3327-8 plugs.)

•Spark advance in going into UML's engines. Engines now in overhaul are receiving first production installations of the UML Precision Products system. For bleed and climb, power 28-day advance position will be used. This will be advanced to 25 day, during cruise. Result should be a 1% saving in fuel consumption. Using standard this into a yearly economy of \$330,000.

Other advantages from spark advance involve the engine exhaust system. Because of lower exhaust temperatures, UML requires eight better cylinder and exhaust valve guide life. And on the Boeing, the cooler exhaust should benefit turbochargers.

•Coincidentally with spark advance installation, United will undertake a modification program on the K 1508 for

ing engines, changing them from the T536G to the B3 engine. This includes new combustors, emitters and reduction, governing, new, simplified intake duct and low pressure turbine. •The engine acquisition is going UML, \$6,000 yearly, because the No. 1 cylinder on K 2000 engines failed at frequent intervals, between engine change, the cylinder is now changed at end point. Unchecked engine changes have been mutually reduced.

Avionics

United Air Lines has long been an exponent of automatic pilot and associated equipment. The airline's DC-10s have been operating with the Boeing A-17 autopilot, automatic approach control and automatic elevator trim for the last five years.

•Autopilot. The civilian competitive equipment, UAL ordered Eclipse Precision PB-10 autopilots delivered as its DC-10 aircraft.

E. P. Buckholz, chief test and development test engineer, told UAL made a test evaluation of Bendix's automatic approach control Model Flight Path Control, plan automatic elevator trim a year and one-half ago. The aircraft

were already provided with automatic altitude control.

Although Eclipse Precision offered automatic approach control in competition with its automatic approach, UAL has declined it at first. At the present, according to Buckholz, the expense, added weight and maintenance of the equipment was not justified because of the limited time the equipment operates, during IFR-Bushfield and HPC, however, can direct the aircraft on any VOR route, as well as convert it to the ILS location and glide path.

So, months after the initial PB-10 installation, UAL put a second unit as a DC-10. As a result of the performance of these two test units, the airline decided to go ahead with a fleetwide DC-10 installation of the PB-10.

Buckholz stated that the test unit was fully GA-approved. United test aircraft simulator only used to develop modifications have been eliminated, he added, in imposing specific limits on some motor torque output. These limitations correspond to the approach control used during normal approach attempts.

The two DC-10s will continue service tests with the PB-10. Detail and final engineering of final equipment is almost ready for release. Installation is contingent on delivery of equipment. Expect it to start putting in units in early summer, complete program by fall.

The A-17, with AAL, will go into United's Carrier 140.

•Fuel Program—When the decision to service test the Eclipse Precision PB-10 was reached, Eclipse and UAL assigned two and three engineers respectively to the job of flying the line configuration tests for five days to observe the engine's output. Several changes resulted from this intensive analysis.

One direct result of this five-day program was an improvement suggested and incorporated by Bendix. In comparison to automatic approaches, observers noted that under the latter conditions pilots left the aircraft banked excessively and engines ran too close to the ground for comfort.

Passenger device a method of reducing engine sensitivity control by approximately 30% to reduce rolling moment. One of its objectives was that this would in no way affect the Flight Path Control's ability to keep the aircraft aligned with the runway since the plane has been security "anchored" to the location for as far as the field, prior to reaching the middle turn.

•Preparing for Jet—Underlying reason behind United's whole autopilot/automatic approach program, as expressed by Buckholz, is that jet will have to take over the automatic approach complex too, since conventional jets will

MAINTENANCE hangarwork for Midland is noted and lowered by a path below.

DOCK it snugly against the floor and floor lighting eliminates shadows.

have little operating margin to miss an approach, if that. A fully developed autopilot system will be necessary also, however, in ensuring speed increase, leading faster because a greater and greater percentage of total on route time.

Autopilot and associated equipment may not be absolutely necessary to operate current transports, Buckholz said, but each engine power has its own pilot, and a second is not enough autopilot installation in an event of an engine trouble. "You can't take a part of engine equipment as complete as an autopilot on the flying board and risk it in a plane and have it give you a performance from the first day."

It takes time and study and experience to develop the skill, being into a well-behaved, properly integrated family of mechanical and electronic components.

At the moment, United under no distinction between automatic flow, as without approach complex, as before, maximum, Buckholz says, a 300 ft. Pilot may have to approach on the marker 300 ft. of descent before

reaching it and taking over manually. Next signal step, he points out, will be to reduce maximum climb to 200 ft. and cut off the complex when the pilot becomes contact.

UML engineers noted that work will need to be done on the ground 150 yards to improve it to the point where the entire autopilot system is open "nearly perfect."

•Economic Angle—Autopilot equipment was mainly for an airline. Here is what a United captain flying PB-10-equipped Boeing 737s says on the San Francisco Peninsula run to say about the equipment: "I put approach 7 mph, since on climb-out with a pure autopilot aircraft. At cruise, I have noted up to a 15 mph increase in speed when the automatic altitude control holds the airplane in a constant pitch attitude penetrating shallow descents and climbs which are inevitable when the ship is hand-picked."

•Flight Recorder—Underlying reasons claim that the current has had some experience with flight recorder data from other U.S. airlines. It installed the first recorder over two years ago and is

currently using these recorders in the majority of its fleet of two and four engine aircraft.

UML feels that the use of reliable flight recorder permits an accurate analysis of engine operating conditions, with the result of increased operating efficiency. "A 1% change can be translated into a lot of dollars," UML says.

The Air Transport Assn. is cooperating with UML on its flight recorder program.

•Weather Mapping Radar—United's Caravan 340s have provision for weather mapping radar. A quarter has been left in the middle of the instrument panel. At the moment, the weather map that it has no idea what it is supposed to do, what the radar will do, or how much that will weigh.

Engineers are, however, actively preparing a program to improve radar altimeter function—primarily to test some like conditions and simplify maintenance.

•Tube Tester—UML's radio shop has developed a radio tube testing panel which has used the correct considerable money. In addition, unattended removal of radio equipment has noticeably improved life of the ARC-1 set and has practically eliminated open kit repair jobs. Many more tubes were shipped with the device. Principle of the tester is matching of tube filament resistance going into a single set. This means balanced voltages across tube filaments connected in series, largely eliminating overheating and consequent failures.

•Quality Analysis—N. Drua, power plant engineer says United has settled on the Bendix system as the best installation in its fleet of DC-10s, DC-10s and Boeing 737s. The DC-10 has been being for service test. Decision was based largely on price of the equipment. Bendix, using installation maintenance is now in process.

Davis feels that the industry will be used possibly for trouble shooting and preventive maintenance and preventive engine checks rather than as preventive maintenance.

Mechanical

Unscheduled removal rate of General Electric turbochargers and on the Boeing 737s has caused a serious problem. Peak of about 16 per cent in 1970 has declined to a current 2 to 3 per cent. Engineers have been primarily due to induction system pressure checks according to Davis. Elimination through pressure checks of large waste of turbochargers has not changed as failure in the induction system was largely responsible for this serious incidence, according to

Can YOU measure up at BOEING?

In 1980, CLECO, Boeing's recording tape-measure for use there, is no longer being. Because that's been going on since 1975.

As a Boeing engineer, you'll share the progress of the new technology. You'll have a new design, the first, second, third, and so on, and you'll be working with engineers who have shared working with you in every phase of aviation.

There are recording opportunities, right now, for experienced and junior engineers for aircraft.

- DESIGN • DEVELOPMENT
- RESEARCH • PRODUCTION

also for senior engineers and also for research and development and for production and manufacturing with advanced design.

Working with you will be a professional person in the aircraft field, and you'll be working with a team of people who are working on the same project.

Openings are available in both Seattle and Wichita. You'll share the progress of the new technology. You'll have a new design, the first, second, third, and so on, and you'll be working with engineers who have shared working with you in every phase of aviation.

You'll be proud to say, "I'm a Boeing engineer."

UAE peak shows steady workload of progress in comparison to improvement overhead.

David. He anticipates further improvement in the unit's mechanical control unit as a result of reduced coolant flow pressure resulting from integration of work volume on the B-4300 engine.

▲Appl. Phys.-UAE is introducing its Champion pump. And it continues to overhaul those units that are inefficient material left on other obsolete units.

UAE's production is consistent; it costs 21¢ to overhaul a pump including labor and overhead. A new pump costs about \$1.60, says CUE engineer.

▲Anti-Skid Device-United expects considerable interest in anti-skid devices for its aircraft.

This is the program engineers will lead by service that will be the most important of the modernization. Current 1416 will be delivered with progress for use of the Westinghouse Derivative Program anti-skid, making a prototype DC-6 installation in July, 1982, and possibly a full-scale installation on DC-6, DC-6B, 1416 and 177 in '83.

When anti-skid will be used on 1416, the effect that the Concorde has not been decided.

These budgets have been set aside for anti-skid programs. Concorde \$54,000, DC-6, \$36,000, B-4300, \$24,000, to \$24,000.

▲Fuel Gauge-Minneapolis Honeywell fuel gauges used on Concorde's Boeing 777 engine is for the highest price from the aircraft's engineers and maintenance personnel alike. One engineer expressed his opinion this way: "The units give excellent trouble-free performance." Mechanics on the floor can find no problem.

▲Reading Light-A new reading light is being installed in the Concorde DC-6 which will get some light and not be over-adjustment.

United Air Lines is equally in force of progress maintenance as the most common method of servicing conventional engines, and the figure to view why.

UAE claims for progress that less maintenance is needed in its given jobs and more of the time in making more than, instead of taking up valuable larger space. United says that the servicing system reduces large to quarters by two-thirds.

Other large services, such as Pan American, and smaller ones, such as Frontier, endorse the scheme, but Western Air Lines still stands by its own maintenance and claims for it the same advantages UAE can to progress (Aviation Week Jan. 3, p. 31).

▲The Difference-Principal difference between the two plans is that with progress overhead the peak work time is reduced, starting up at the aircraft's major overhaul period—8,000 to 10,000 fly-by—up to 10,000 fly-by and reduced to 60% of the low levels of minor overhaul stretching between the major peaks.

After about five years of experience with progressive overhaul, UAE says it has been able to "reduce labor costs, reduce facilities requirements, and have fewer airplanes out of service."

▲The Progress-Specifically, United quotes their actual work figure to back up its statement.

• "We have used approximately 45%

on labor during the first cycle of overhaul ended in July, 1981, and will use approximately 14% from that date on during the life of the fleet.

• We eliminated the need for line hangers and docks at a cost of approximately \$100,000 each, or a total of \$2 million.

• "We have avoided the necessity of holding four additional airplanes out of service during the scheduled major period. This situation was scheduled light hours, we would have had to procure these four airplanes either by purchase or lease. The new cost of the DC-6 is approximately \$1 million in a total order of \$4 million.

• Less Covered-Still another advantage of progressive overhaul is reducing the typical congestion caused by large numbers of airplanes congregating in congested areas of the plant footprint (a classic example) and getting in each other's way to the point where work was seriously hindered.

Aircraft maintenance under UAE's program overhaul system are 10 DC-6, 21 C-141 and 4 Boeing Stearman. The Concorde's 16 DC-6 is excluded from the plan because of the somewhat advanced state of the aircraft (progressive overhaul part of the larger it is an effect) and also because the work overhead as likely will be reduced.

• Maintenance Analysis-United has evolved a thorough, comprehensive and efficient review of maintenance methods. After inspection into those advantages it provides the figure at one of the largest companies, immediately, it quickly differentiates between a classic aircraft as a maintenance that is classic on a fleet-wide basis.

At UAE, progress is "The system is designed to flag out the aircrafts or systems that does not function properly at the maximum time possible."

The maintenance system group members performance of equipment for manufacturing conditions. Given two, also applied is reported through pilot's log or response map on components checked in scheduled maintenance. They claim minor for removal, one of trouble, repair made. This information is passed on individual flight is, maintenance checks. They have the responsibility of verifying the proper person is dependent (usually service engineering or an engineer responsible for a status review) in case of a malfunction or classic condition is required.

Data control on the short work, pilot's comment, mechanical correction action taken, date, station. Time saved involved. A glance at the sheets reveal not only check-out, why saving overall components but also time that are trouble-free operations.

• Regular Replacement Classic-Air

the most day a plane takes him to California. He is either all loaded at Travis AFB or, if on a C-119 or C-97, may fly direct to San Antonio from Hawaii. Either at Travis or San Antonio he is greeted by C-47 to a hospital in the interior.

So far, so efficient is the evacuation system that Maj. Gen. Barry G. Armstrong, USAF Surgeon General recently told the 52 Asia in New York City of an officer who left Truac, was flown to Kansas, fought 40 minutes, was wounded and was back at Truac six days after he had reported that field.

Capital, NWA Plan To Keep All Routes

Industry reports that Capital Airlines might sell its southern routes to Delta Air Lines are flatly denied by a Capital spokesman.

Capital and Northwest Airlines will keep all their present routes where they merge, a Capital spokesman says. And Capital has not negotiated with Delta or any other line for sale of its routes, he adds.

The parent Delta-Northwest merger anticipates a continuing an acquisition of a linking route between the North east and Delta systems, preferably New York-Victoria. This has led to some speculation that Delta might try to buy Capital's Route 55 or merge with National Airlines.

But Capital considers its New York-Albany route (as Route 55) as one of the best and has no plans to sell it, the company says. And Capital and Northwest believe Capital's southern route system is a valuable asset. In fact, it also will help offset the winter slump of the northeastern part of the Northwest Capital system, the two managers believe.

Free for a sale of Capital's southern routes, therefore would be so high that no airline would be able to try it, the Capital spokesman indicated.

Connie Flies Nonstop Sydney to Singapore

Lockheed Aircraft Co. has announced that Queen Flight Airways, Ltd. Model 747 Constellation recently made the first nonstop flight in the history of aviation from Sydney to Singapore.

Flown by Captain Jackson, the "Lancaster, Blenheim" test, left from Sydney at 1315 GMT Feb. 4 and landed at Singapore at 1940 Feb. 5. The 15-45 hr. flight covered 5,939 statute miles. Lockheed spokesman declined

AIRPORT SAFETY will be the aim of a special commission monthly appointed by President Truman. The President in shows reviewing the report to Lt. Gen. James H. Doolittle (middle right), chairman, CAA Administrator Charles F. Brown (middle right), a member, and S. Paul Johnston, executive secretary and chief director of the commission. Dr. Jerome C. Brunsen, NACA chairman, is third member of the commission.

Airport Safety Study Under Way

Lt. Gen. James H. Doolittle, chairman of the special Presidential Commission on Airport Safety, announced last week that the main efforts of his commission will be to provide for "the safety, welfare and peace of mind of moderate size airports. It is these needs will be considered."

Doolittle made it clear that he's concentrating his task strictly on airport planning—not to general aviation. "I do not to emphasize that this commission has not been directed to investigate accidents, but will, of course, consider statistical analysis of those which have occurred so that it can formulate a sound airport development policy for the future," Doolittle said.

Doolittle announced that the working staff of his commission would be executive secretaries and staff director—S. Paul Johnston, director of the Institute of the Aeronautical Sciences, other advisers—Philip A. Hahn, CAA Office of Airports, A. D'Arcy Harey, CAA executive, John W. Crowley, Jr., assistant director for research of NACA, Corp. W. F. Casper, Chief Baker and Col. Ben. Hahn USAF.

The other two members of the three man Doolittle Commission are CAA Administrator Charles F. Brown and Dr. Jerome C. Brunsen, chairman of the NACA and head of MIT's aeronautics engineering department.

■ Hearings Not Public—Hearings of the commission will not be public.

Doolittle says he has no idea whether Newark Airport will be expanded

Dr. Jerome C. Brunsen

(Massachusetts Commerce Secretary, Charles Brown) and last week that New York Airport would be "back soon as a restricted base."

Doolittle also pointed out that jet aircraft operation at airports will be an important part of the commission's task. The commission is talking with several manufacturers to find out whether present reports meet the requirements of future aircraft.

The commission is selecting the airports "in writing" of all individuals and agencies concerned with airport use and construction. Only after gathering this information will the commission make field studies of individual problems involving like New York, Chicago and Los Angeles, Doolittle said.

WHAT Area DOES CANADAIR COVER?

Equal in size to a vast building 550 feet wide and over 5,000 feet long, the 42 acres of covered factory space, with 70 acres for expansion, combine with the adjoining airfield to make Canadair an important factor in world aircraft production.

Production-oriented ventures from all parts of the world constantly stream on the up-to-the-minute equipment that fills bay after bay and in its great open spaces they are one of the many reasons for smooth rising high productive capacity.

With acre after acre of some of the finest aircraft manufacturing capacity in Canada, now turning out a variety of military aircraft, is capable of producing all types of aircraft from design to completion.

continue the distribution of the 15-month supplies.

• Civil Aeronautics Board staff is getting surface wage and supplies cost increase data to decide whether to raise fares. It has suspended a string of inflation charges that might have waited to place on cargo shipments ended after a 24-hour-at 50 cents per lb. or go 55¢ while CAB will investigate the question.

• Eastern Air Lines has signed a seven-day and pay raise contract with the IAM Machinists Union (AFL). Three cents for employees in the IAM category to raise the union after 60 days. Rate is 2 cents on base retroactive to Oct. 1, and another 2 cents that July 1. Pay increases of 4 cents over six months to come up in the November rate are also provided. ... Has started a Detroit-Miami morning flight with Super Constellation in a move to meet competition started last year by a Capital National interchange. The new stage route however line is about an hour and about double Eastern's service as that line.

• West Airways launched 6,663,316 one-way domestic air freight in January, a 24% gain over a year ago.

• Southern Airways starts serving its line and Gulfport on its Mobile-Jackson route this month.

• Trans World Airline reports 147,000,000 revenue passenger miles flown in January, 24% over a year ago.

• United Air Lines flew 157,146,000 revenue passenger miles in January, 25% over 1955. Air freight declined 9% to 1,890,000 ton miles (on gross ton) over 1955 for passengers and 18% for freight. Company will offer 31% more trans-oceanic cargo capacity this year than last.

• National-Central merger application was not expected approval by CAB even though it's consolidated with the cutoff New England Southern Status merger investigation case. The Board is considering separate hearing of the one case of single merger of the two lines leaving all other cases consolidated in the investigation case.

• North American Airline plans to make inquiries with Douglas and Lockheed about possibilities of lease per lease deal for about ten new DC-6Bs or DC-7s or Super Constellations. The North American reported by Stanley Weiss and James Fuldman in Los Angeles, handles close to one-fourth the nationwide commercial passenger.

• Northeast Airlines has set up a military division of its line dept. to expedite domestic troop movements. ... Passenger load factor of 55% this line or compares with 46% a year ago. per seenger loads totaled 40,885,830.

• Pan American World Airways airplane in the Transport Western Union, CO, would get these wage increases if the main contract renegotiations of the Postal Telegraph Employees' Board rates of 10 to 15 cents an hour for ground workers and of 51¢ a month for flight service personnel. Pan Am has asked the union leaders to raise wages 14 to 16 cents an hour gain for ground and 54¢ a month for flight service personnel. The Emergency Board officials both companies and main contract of the wage dispute.

• Eastern Air Lines delivered 18,857 passengers to American Airlines last year, hauling America 5500,000 new ones, almost half Eastern's total revenue profit for the year.

• Silema starts trans-Atlantic coach service May 1 using 60-passenger DC-6 carrying luxury passengers and "tourists" forward-three flights a week. On Jan. 15, company will add an all-cabin 59-passenger DC-4 flight. By July 1 it will offer four coach and two luxury services per week.

• West Airways launched 6,663,316 one-way domestic air freight in January, a 24% gain over a year ago.

• Southern Airways starts serving its line and Gulfport on its Mobile-Jackson route this month.

• Trans World Airline reports 147,000,000 revenue passenger miles flown in January, 24% over a year ago.

• United Air Lines flew 157,146,000 revenue passenger miles in January, 25% over 1955. Air freight declined 9% to 1,890,000 ton miles (on gross ton) over 1955 for passengers and 18% for freight. Company will offer 31% more trans-oceanic cargo capacity this year than last.

Good News for Engineers

...LOCKHEED IN CALIFORNIA RAISES ENGINEERS' SALARIES

Lockheed Aircraft Corporation engineers substantial salary increases for engineers in recognition of the importance and excellence of their work as both military and commercial aircraft. The increases, now in effect, make Lockheed engineers among the highest paid in the aircraft industry.

Engineers who join the Lockheed team will receive the benefits of five pay bands.

In addition to increased salaries, Lockheed also offers engineers:

1. A "bonus" every day in better living—just because you live in Southern California, in an area where the climate is beyond compare.
2. A future that offers both security and advancement, helping create planes for defense, planes for the world's airlines in Lockheed's long-range development program.
3. Better personal working conditions among men who have built a reputation for leadership in aviation.

EDITORIAL

Politics & Safety

The recent reshuffling of the Office of Aviation Safety in the Civil Aeronautics Administration made good newspaper headlines and now has the public for a while, but it's disappointing few people in aviation or CAA who can read between the lines. The political battle rages supreme over integrity, ability and public service, to the opinion of most of our readers.

A two-paragraph editorial on the page Feb. 11 ("What Goes on at CAA?") expressed our view of no confidence in those who manipulated the reorganization and those who courted the office. Those two paragraphs stirred a hailstorm of phone calls, telegrams and letters pouring into our office, and this is still raining.

These messages came from CAA employees and from officials of aviation companies who are tied up with the pelvis of T. S. Hazlett, director of the office and his deputy director, William Davis. These two men, incidentally, were the only men of Code 35 or above in Aviation Safety who were not compelled to take "vacation status" for jobs in the reorganization. It was then when Bush, we understand, now has applications in process for higher grades for themselves.

It is obvious that inside in CAA Aviation Safety is low, and that some aviation individuals and companies who have been valuing under deliberate decisions from Hazlett, Davis and some of their men, are still afraid to complain because of reorganization.

Several observations on the newly reshuffled Office of Aviation Safety in a reorganization of the Civil Aeronautics Administration set up by CAA that held men until it was abolished in November 1957. Even this decision, however, did not control the Medical Division, nor the Aircraft Engineering Division. Hazlett now has both of these important groups in Aviation Safety.

The CI group, described in aviation as "the old guard" was an empire-building bureaucracy within CAA that became so politically, doctrinally and political, and as lacking in proficiency and service to the public, that it is finally sold up.

That is not vision, other skillfully planned "reorganization" team, substantiated in that latest one, have gradually turned the old guard on one corner to even greater power than it ever had before. Our statements indicate that only those who can be trusted on an "old" member of the Hazlett-Davis clique, master of politics and conspiracy created agencies or new appointments or personnel. Others were banished to the side, their jobs abolished entirely, as they were not in grade and skills.

Integrity, technical ability and public spirit, to be sure, safety seems to have been what really stood in the latest reshuffling of men around the country in jobs to visit to aviation and human life.

Research shows that in eight U. S. senators and six civil organizations, because concerned about a reorganization, we will make official inquiries. They now hold five "the best man" men, being installed in all key positions of CAA Aviation Safety. To stop them at once. Actually, those are seven jobs in Hazlett's setup and directly connected with his safety, and the Civil Aeronautics Administration Hazlett agreed to his own reorganization, it still headed to T. S. Hazlett who has held the post for some time.

Naturally, members of Congress were reluctant to interfere if the changes would improve air safety. It is our opinion they won't. If there are more fatal cases, accidents,

in the near future, the whole Hazlett-Davis empire may come under very heavy fire.

Meanwhile, a story in the New York Journal-American created a sensation within CAA. It described how some of Hazlett's men struggle to keep out the country on aircraft. Furthermore, it described the "griping" safety, CAA people themselves are conducting rigid control.

Further, there will continue to look into various aspects of CAA Aviation Safety, scientific, and no reference further suggestions from those on business who have been victimized, as well as from those on CAA's payroll who are eager for a new deal. Obviously, none of these who send an editorial will not be devoted to anyone.

There are some of the religious faith, with courage and conviction that eliminated.

APPROPRIATE YOUR EDITORIAL ON CAA REORGANIZATION, KEEP UP THE GOOD WORK IN THE INTEREST OF GOOD GOVERNMENT.

CONGRATULATIONS ON YOUR EDITORIAL RE CAA REORGANIZATION. EVERYONE HONESTLY FEELS REFL AND KNOWLEDGE HAVE NOT BEEN CONSIDERED AS BEING MORE DESIRABLE THAN BOOT LICKING BY SELECTING KEY PERSONNEL.

GLAD ONE MAN COULD SEE UNDERSTANDING AND HOW THAT IT TAKES TO ENTER CAN REORGANIZATION. FROM IT'S A GOOD START. KEEP IT COMING. EVEN IN THIS WORLD WOULD THAT SUCH AN ATTEMPT TO REMAIN INEFFICIENT, HONESTLY AND QUALIFICATIONS IN SUCH FOR LATELY APPROPRIATE IN FAVOR OF "YES" MEN, CANNOT BE FORGOTTEN BY THE INTEREST. IN THIS WORLD IT WOULD BE SURELY SELL OUT THE INDUSTRY AND BUY RATHER STOCK. WE KNOW THAT WILL PROVE, RE-ENTRY EVEN THOUGH OF US IN AVIATION FOR MANY YEARS ARE BEING TRICKED ON THEM FOR FEAR AFFAIRS OF OUR SAFETY ON AIRLINES.

CONGRATULATIONS ON YOUR PURSUE IN PROPOSED STANDS CONCERNING CAA REORGANIZATION. MANY OF US IN THE INDUSTRY ARE YOURSELF CONSIDER MANY OF THE NEW TOP LEVEL APPOINTMENTS TO BE TO THE INDUSTRY. INDUSTRY FOR POLICIES AND THAT CAPABILITIES AND COMPETENCE WERE NOT CONSIDERED. CERTAINLY THE SUPPLY AND DEMAND FOR THE INDUSTRY AS SET FORTH IN THE CIVIL AERONAUTICS ACT OF 1957 WAS RECORDED BY THOSE PEOPLE RESPONSIBLE FOR MANY OF THESE NEW APPOINTMENTS. I AM PREPARED TO FURNISH EVIDENCE, WITH CONSIDERABLE INFORMATION CONCERNING INTERNAL POLICIES IN CAA THAT BELIEVES DELIBERATE TO THE EXISTING SITUATION AND THAT HAS BE IMPROVED CIRCUMSTANCES WITHIN CAA AND BELIEVES DIRECTLY UPON AVIATION SAFETY. THAT I WILL BE GLAD TO FURNISH UPON YOUR REQUEST. WE MAKE OUR WHOLEHEARTED REQUEST THAT YOU MAKE THIS THOUGHT AND ADVISE US THAT YOU CAN DEPEND ON OUR ASSISTANCE AND BACKING.

THANKS FOR TIMELY EDITORIAL ON POLITICAL FOOTBALL. PUBLIC NOW ALERT AND AGENT AND READY FOR SOME ACTION IN SELECTING POLICIES IN CAA. WE NEED MORE AND STRONGER EDITORIALS SETTING OUT AS YOU HAVE DONE.

THIS IS THE REORGANIZATION THAT AVIATION SAFETY DAILY described Feb. 15 is a well planned, however, present which should improve CAA's dealings with the industry. We'll planned it was that even well had one our time!

—Robert H. Wood

FUEL METERING

Where Today's Ideas Become Tomorrow's Achievements

America's world leadership in aviation is due largely to the industry's ability to convert dreams into realities—to apply creative engineering to the solution of every new problem.

The Bendix Products Division of Bendix Aviation Corporation is proud of the part it has been able to play in meeting this challenge of constant product improvement. And Bendix

Products pledges its knowledge and resources to a continuation of this program of progress so essential to world leadership.

If the Bendix Products Division of creative engineering and quality production can assist you in the development of tomorrow's fuel metering, struts, brakes or wheels—just let us know. Your inquiry will receive prompt attention.

LEADER IN LANDING GEAR

NO. 10, 1, 1957-1958

Official U. S. Navy Photo

Mission accomplished

The coast line fades in the distance as the swift twin-jet Banshee returns to the aircraft carrier—mission accomplished.

On this shark-slim jet fighter, the McDonnell F2H-2, are actuators developed and produced by Foote Bros. to the exacting requirements laid down by the U. S. Navy and McDonnell engineers. These actuators must be rugged in construction—light in weight—designed to fit a confined space envelope. Above all, they must operate swiftly—surely.

Foote Bros. gears, actuators, and mechanisms are today serving on many of the nation's leading aircraft and aircraft engines.
